BACKGROUND

Specific to riparian community function, we reviewed and evaluated the current application of 2D hydraulic models when used for this research.

We identified the practical considerations and limitations when using these models in an attempt to set realistic expectations for 2D model use in the riparian zone.

METHODS

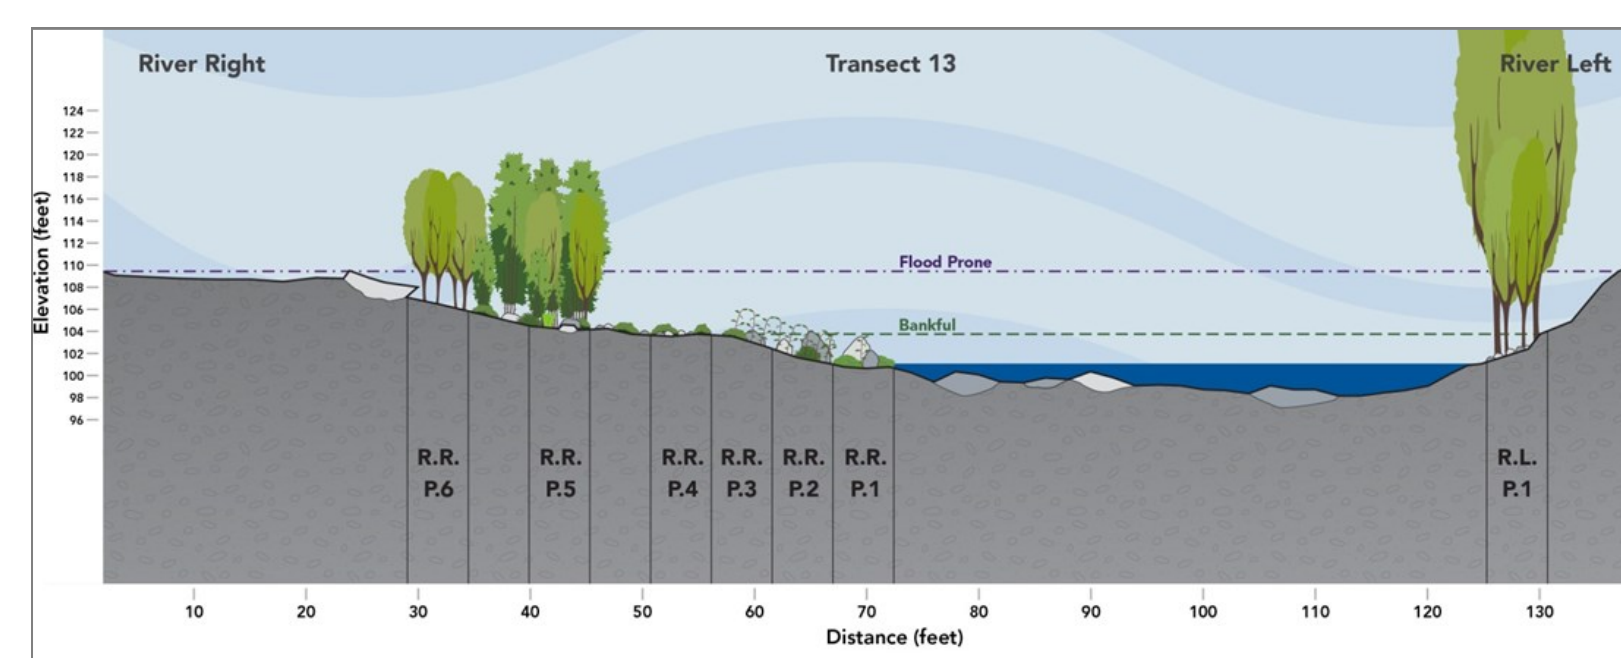

The regulated hydrograph and interaction with riparian zone has been studied in detail. Often, riparian zone research is built on the back of fish habitat models, geomorphology models, or floodplain inundation models.

Using data from recent studies, we evaluated the most common questions related to riparian zone function and addressed those that could be studied with a 2D hydraulic model.

We reviewed the application of the Bureau of Reclamation's Sedimentation and River Hydraulics (SRH-2D V2) model (Lai, Y.G., 2008) and the River2D (Steffler and Blackburn, 2002) and River2D Morphology (R2DM V7) models (Kwan et al, 2011).

PHYSICAL RIPARIAN ZONE PROCESSES

- Inundation: Magnitude, Frequency, Duration
- Community Structure: Spatial Distribution, Age, Species Diversity and Abundance
- Groundwater Interaction: Depth, Temporal Variability, Connectivity
- Root Zone Depth Requirements
- Species and Community Substrate Requirements
- Seedling Tolerance and Recruitment

2D MODEL APPLICATION

2D hydraulic models provide a detailed velocity description in the channel as well as in the floodplain, with certain limitations. They can resolve areas with high velocity gradients and interactions between the main channel and the floodplain.

The models provide bed shear stress based on depth averaged uniform flow. SRH2D v2 does not incorporate sediment transport or vegetation functionality at this time. R2DMv7, is intended to model general bed changes, but not local scour.

Transient event analysis incorporates hydrologic data, historic, baseline, operational scenarios, and climate change predictions to determine the effect on inundation, and associated metrics.

PRACTICAL CONSIDERATIONS

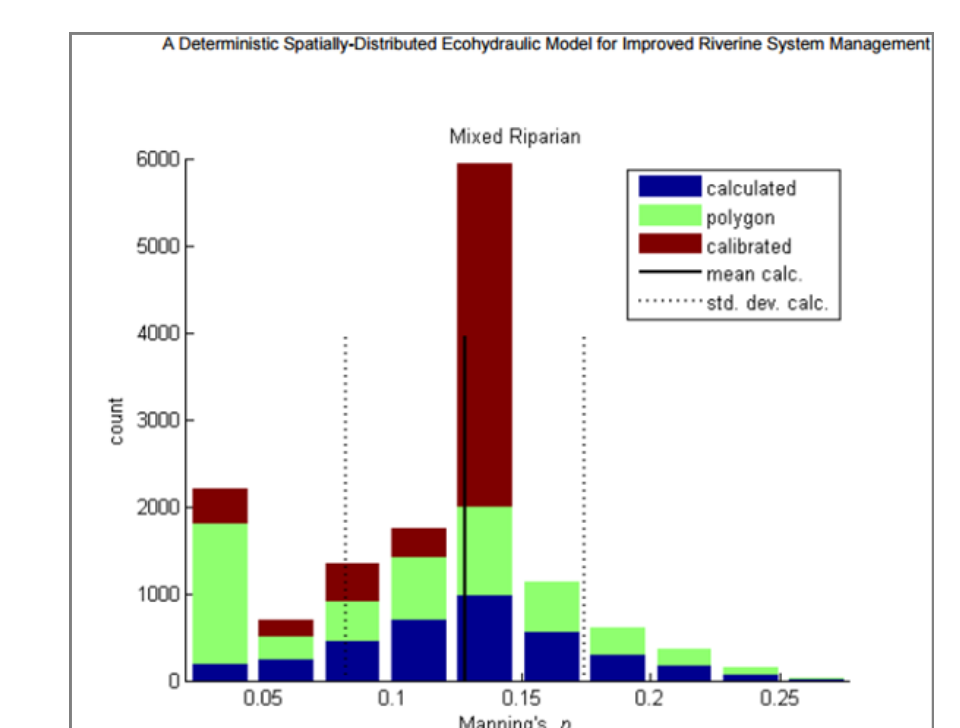

Hydrology Development - Time scale important to riparian zone processes. Daily vs. hourly time step.

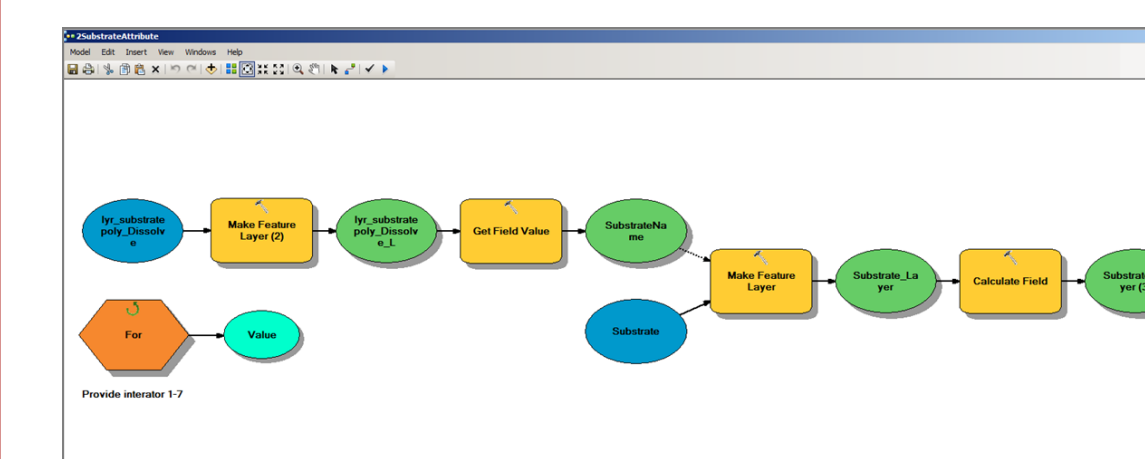

Boundary Conditions - Site specific rating curve development critical to accurate WSE and inundation predictions.

Steady vs. Unsteady - Related to hydrologic time step, careful consideration of the importance of hysteresis on bed shear and sediment mobility.

Riparian Vegetation and Hydraulics - Modeling 'vertical roughness.' Effects on the flow field. SRH2Dv - not yet public.

Spatial Predictive Model Development - Relational species models developed using output from 2D hydraulic models, substrate mapping, vegetation mapping, LiDAR data and field verification. Data intensive, multi-year.

Table 3.3-5. Association between the area of canopy (ft²) of white alder (*Alnus rhombifolia*), cottonwood (*Populus fremontii*), Western sycamore (*Platanus racemosa*), and willow (*Salix spp.*) and substrate size.

Substrate Size ¹	White alder (<i>Alnus rhombifolia</i>) ²		Cottonwood (<i>Populus fremontii</i>) ²		Western sycamore (<i>Platanus racemosa</i>) ²		Willow (<i>Salix spp.</i>) ²	
	Area (ft ²)	% of Canopy Area	Area (ft ²)	% of Canopy Area	Area (ft ²)	% of Canopy Area	Area (ft ²)	% of Canopy Area
Gravel (0-10mm)	140	3.2%	120	2.8%	0	0.0%	17,240	42.0%
Coarse Sand (10-20mm)	1,040	23.7%	1,040	25.2%	16,710	40.7%	215,210	52.2%
Fine Sand (20-60mm)	480	11.0%	480	11.6%	6,810	16.5%	88,410	21.5%
Large Cobble (60-100mm)	410	9.3%	410	9.9%	4,080	9.9%	104,410	25.6%
Medium Cobble (100-150mm)	11,710	26.8%	11,710	28.5%	103,710	25.3%	1,249,110	30.8%

² Vegetation mapping data derived from WRI (2012).

CONCLUSIONS

- Improved Hydrologic and Hydraulic Relationships, Consideration of Time Step Important
- Transient Event Based Models Required to Better Predict Key Bed Shear and Sedimentation Processes
- Data Requirements Growing With Modeling Expectations, Data Collection Very Time Consuming and Expensive
- Consideration of Vegetation Roughness Shows Promise, Not Yet Available in the Public Domain
- No One Complete Modeling Solution, Multi-model Crosswalk Evaluations Required
