

New Methods

Old Dogs doing New Tricks?

- ▶ Linking ecosystem components (i.e., hydrology, biology, geomorphology, connectivity, water quality).
- ▶ How do new methods compare to historical methods? Are they better or just more complicated.

Reduced
Uncertainty

Money Spent
Technological Tools

An orange, wrist watch and a stream

- ▶ 1978
- ▶ Bob, Bubba, and Elroy
- ▶ Stream side quantitative assessment of minimum instream flows

Let's get Sophisticated

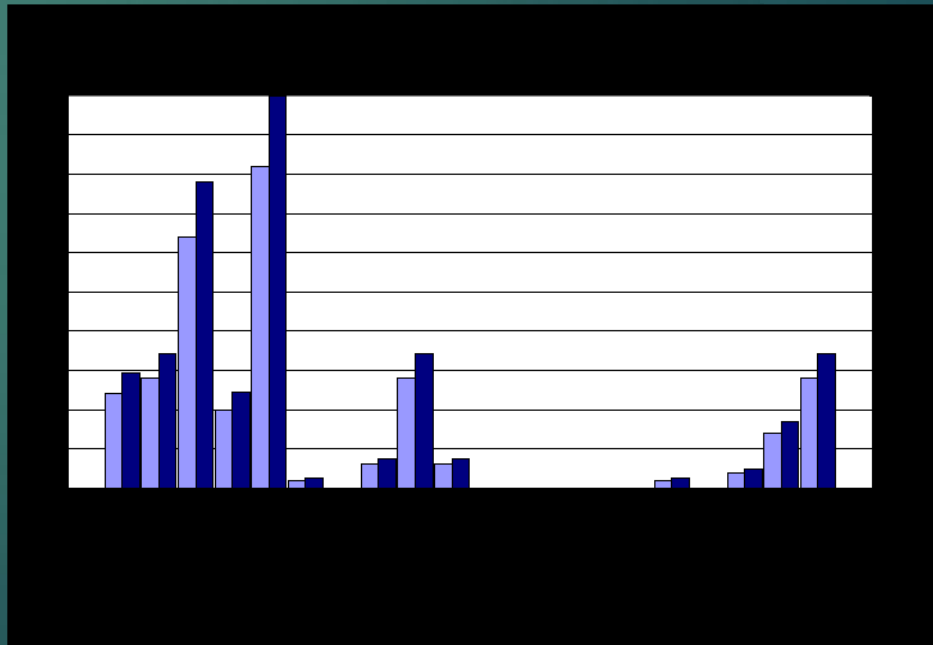

1982

- ▶ Hardy, T.B., C.G. Prewitt, and K.A. Voos. 1982. Application of a physical habitat usability model to the fish community in a spring-fed desert stream. In: Analysis of Ecological Systems: State-of-the-Art in Ecological Modeling (Lauenroth, Skogerboe, and Flug, Eds). Developments in Environmental Modeling 5. Elsevier Scientific Publishing Company. 391-397 pp.
- ▶ Exponential Probability Density Functions to fit the joint distribution of depth and velocity frequency distributions for availability and fish use to derive preference curves for several species
- ▶ Examined predicted habitat suitability spatially with species distribution

“The Technological Avalanche”

- ▶ Computing power – from punch cards to workstations
- ▶ Advanced spatial data collection
 - ▶ Aerial photogrammetry
 - ▶ LIDAR
 - ▶ ADCP
- ▶ Availability of Computational Software
 - ▶ PHABSIM
 - ▶ River2D
 - ▶ SWMDMS
 - ▶ EVA
 - ▶ CASHMIR

Steelhead 1+ modeled habitat at 38 cms

Oranges to Multidimensional Integrated Modeling

- ▶ New techniques do not necessarily invalidate historical methods whether they are hydrology based on simplified habitat modeling
- ▶ Emerging techniques trend toward more spatial resolution on the engineering (hydraulic) components, sometimes better temporal resolution, multi-disciplinary integration..... but the biology resolution is lagging (still just physical habitat)
- ▶ Most newer techniques are contingent on high data collection and analysis needs – Means more time and money
- ▶ We are still faced with situations where data is lacking but decisions are necessary... what to do?
 - ▶ Hydrology Methods remain a viable tool

Are we really doing better or just making pretty pictures with more complicated methods?

Holistic Method: integration of multiple components in flow modeling

Tom Payne – Normandeau Associates

The San Juan River population model: linking ecosystem components, management actions and fish numbers to address uncertainty in new ways

Bill Miller – Miller Ecological Consultants

Dealing with uncertainty: statistical analysis and risk assessments – tools for establishing robust instream flows

Dorian Turner – British Columbia Hydro

Bayesian probability modeling

Jim Peterson – Oregon Cooperative Fish and Wildlife Research Unit, Oregon State University
